

Use-Case Flow Specification

Use Case: Grant Access Permission

Preconditions

- The patient must be logged in and authenticated on the system
- The patient must have medical records available in the system
- The patient must be able to access the consent management interface
- There must be at least one clinic or diagnostic lab already registered in the system

Postconditions

- The access permission gets saved in the system database
- The system automatically creates an audit log entry showing this consent was granted
- The patient gets a confirmation message via SMS or email
- The clinic gets access to the selected records during the specified time period
- The patient can see this permission listed in their consent history

Main Success Scenario

1. The patient goes to "Grant Access" from their dashboard.
2. The system shows a list of all verified clinics and diagnostic labs they can give access to.
3. The patient finds and picks the clinic they want (like "Apollo Diagnostics, Chennai").
4. The system shows the clinic's details and what kinds of records can be shared (like Lab Reports, Scan Images, Medical History).
5. The patient checks the boxes next to the records they want to share with this clinic.
6. The system asks the patient how long they want to give access for - they can pick 24 hours, 7 days, 30 days, or enter a custom time.
7. The patient chooses how long they want access to last (for example, "24 hours from now").
8. The system shows everything the patient just set up - which clinic, which records, and for how long.
9. The patient looks it over and clicks "Authorize Access" to approve it.
10. The system checks that everything is correct and the clinic is legitimate.

11. The system saves the permission to the database in an encrypted form.
12. The system writes down what happened in a permanent log that can't be changed.
13. The system sends the patient a confirmation message to their email or phone number.
14. The system shows the patient a success message telling them when the access will expire.
15. The process is complete
